This article will explain the way to install Android Studio on Ubuntu 18.04. When we start Android Studio for the first time, the below window will appear asking us to import Android Studio settings from a previous installation: When we click on the OK button, the Setup Wizard window will appear. Android Studio is a full-featured cross-platform IDE which helps us to build applications for Android device. We do not have to modify any files or type in any scary commands. It will download and install the required SDK components. The installation is very simple, we can start by updating the package index: `sudo apt update` Now install the OpenJDK 8 package using the below command: `sudo apt install openjdk-8-jdk` To verify the installation we can use the below command to check the version: `java -version` The output will be something like this: `openjdk version "1.8.0_191" OpenJDK Runtime Environment (build 1.8.0_191-8u191-b12-2ubuntu0.18.04.1-b12) OpenJDK 64-Bit Server VM (build 25.191-b12, mixed mode)` Installing Android Studio To download and install the Android Studio snap package, we have to open our terminal using the Ctrl+Alt+T keyboard shortcut and type the below command: `sudo snap install android-studio --classic` When the installation gets completed, we will see the following output: `android-studio 3.3.1.0 from Snapcrafters installed` Now Android Studio has been installed on our Ubuntu desktop. Starting Android Studio Once the Android Studio is installed in the system using any of the above methods, we can start Android Studio through our terminal by typing `android-studio` in our terminal or by clicking on the Android Studio icon. To install Android Studio we can visit the Ubuntu Software Centre and search for Android Studio. We will get a password prompt to confirm the installation process. It should be installed successfully, but for some reason, if it throws an error like this: `error: This revision of snap "android-studio" was published using classic confinement and thus may perform arbitrary system changes outside of the security sandbox that snaps are usually confined to, which may put your system at risk.` Then we have to add the `--classic` parameter to the command as shown below: `sudo snap install android-studio --classic` Once it installed successfully, we can check the final setup section. Method 3: Using the Zip File Installing Java OpenJDK To install Android Studio we require OpenJDK version 8 or above to be installed in our system. We can use the same instructions for Ubuntu 16.04 and any Ubuntu-based distribution, including Kubuntu, Linux Mint, and Elementary OS. Prerequisites: We need to be logged in as a user with sudo access. We can install Snap, using the below command: `sudo apt-get install snapd` Once the installation of Snap gets successful, we can proceed to install Android Studio with the below command: `sudo snap install android-studio` It may take some time, hence we have to wait for some minutes. But we need to have Snap installed in our machine in the first place. We can select the "Standard" option or "Custom" option if we want to customize our Android Studio. We can select the UI theme and the Setup Wizard on the next step. This IDE includes everything we need for Android development. Once the Android Studio IDE is loaded, the Welcome page will be presented: Want a more fast-paced & competitive environment to learn the fundamentals of Android? Click here to head to a guide uniquely curated by our experts with the aim to make you industry ready in no time! It will make our system able to install packages on our Ubuntu system. System Requirements for Installing Android Studio in Ubuntu These are some important specifications our machine needs to meet: 64-bit distribution capable of running 32-bit applications. GNU C Library (glibc) 2.19 or later. Minimum of 3 GB RAM, 8 GB RAM recommended; plus 1 GB for the Android Emulator. Minimum disk space should be 2 GB, 4 GB Recommended (1.5 GB for Android SDK and emulator system image + 500 MB for IDE). The minimum screen resolution should be 1280x800. Method 1: From The Ubuntu Software Centre We can easily install Ubuntu software from Ubuntu Software Centre but desired software must exist in the software store. Now option to choose the type of setup we want for Android studio will appear. Once the installation gets completed we will have the Android Studio icon in our application tray. The process may take some time depending on our system and connection speed. Android Studio build system is powered by Gradle allowing you to make multiple build variants for various devices from one project. We have to click on the Next button to start the initial configuration and post-installation steps. Once we found the software easily click on the install button. First, we will install OpenJDK 8. Android Studio is based on JetBrains' IntelliJ IDEA. Once it installed successfully, we can check the final setup section. Method 2: Using The Snap Tool When the snap tool is available it becomes too easy to install software packages.
