## How to roll back windows 7 to a previous date

Contact Arkadium, the provider of these gamesSee if you have the hot hand today and roll for a high score in this classic 5-dice game. Try your hand at the poker of dice games, roll your dice and look for pairs, 3 of a kinds, full houses and straights. See if you can't beat your own odds in 5 roll! Car windows are typically a sheet of glass set into a scissor-pulley track, turned by a crank that is either hand-operated or motorized. When the glass does not roll up and close, several parts may have malfunctioned and require repair. The average mechanic will spend about a half hour to disassemble the door and fix the problem. Remove the door panel to access the window's mechanics. On most vehicles this is done by unscrewing one or more screws set behind the interior door handle, then pulling on the panel to uncouple the plastic pressure rivets. With manual windows, remove the screw holding the window crank to the mount. Once the panel is off, there will be openings in the sheetmetal to access the window pulley and crank. Check the window glass's position in the track(s). If the glass has become dislodged from the track, or tilted to one side, it may not raise when cranked. The tracks themselves may have come loose over time, and may need to be tightened for the glass to fit properly. For manual windows, check the operation of the crank and its connection to the scissor-shaped jacking mechanism. If the crank's operation does not move these arms, the window will not raise. Normally, the entire window pulley system must be replaced when one of the mechanical parts of it fails. For electric-powered windows, check the fuse and wiring circuit to the motor, including the operation switch. Any of the points in the electrical system can fail, and prevent the window from moving. The battery might be dead, or the car's ignition may not be turned on, as some cars require for window operation. The motor itself may fail after years of continuous use, and it is replaced by disconnecting its wires at the adapter plug and unbolting it. Free the window glass, as the window is being prevented from moving. Ice and snow can freeze the window in place, as can glues and adhesives. Removing or melting the blockage will allow the window to move. Late last night, Yusuf Mehdi, a longtime 'Softie best known as the head of Windows Marketing, posted a sweeping view on the Windows blog of what happened yesterday with the Windows 10 rollout. Based on posts from far-flung places, it's quite possible that Mehdi is the only senior exec who stayed in Redmond for the festivities. Here's what he had to say: Our top priority has been ensuring that everyone has a great upgrade experience, so, we are carefully rolling out Windows 10 in phases, delivering Windows 10 first to our Windows Insiders. While we now have more than 14 million devices running Windows 10, we still have many more upgrades to go before we catch up to each of you that reserved your upgrade. Rest assured we are working 24×7 to continue the upgrade process and are prioritizing the quality of your upgrade experience over anything else. While the 14 million number may not impress some people -- after all, Microsoft had 5 million people in the Insider program, and many of them have been running the final build 10240 bits for two weeks -- it's still a respectable accomplishment.No, the Internet didn't melt down. Microsoft's slowly releasing Windows 10 to those who have the combination of hardware and software that's most likely to be receptive to the Win10 jolt. If you signed up for the Win10 program (still no word on how many made that list) and don't have "your" copy of Windows 10 yet, be of good cheer: Microsoft's going slowly, hoping to vet the inevitable bugs before it gets to your particular configuration.When your PC hits the big time, one of two things will happen. Mehdi says you should see a notification popping out of the Get Windows 10 icon in your system tray, saying "Your PC is ready for your free upgrade."I have one Windows 8.1 machine, though, that didn't work that way. My Get Windows 10 icon disappeared, but when I switched over to check for updates, I saw a big notice that says, "Upgrade to Windows 10 / Start installing the newest version of Windows now." I didn't click on the Get Started link, and waited overnight to see what would happen. True to its word, Microsoft didn't try to push the update onto my machine; it's still sitting there, waiting politely, though the machine is set to Install Updates Automatically.At least in my experience, those of you who opted into the Windows 10 update program can breathe easy: Win10 won't be installed on your machine unless and until you explicitly give your permission for it to go ahead. If you don't want to wait, you don't have to. Although Mehdi's post doesn't mention it, you can go ahead and suck from the firehose by following the steps I outlined a couple of days ago.Based on lots of anecdotal evidence, if you decide to take matters into your own hands, the best approach is to first use Microsoft's tool (described in my blog post) to "Upgrade this PC now." If you don't trust Microsoft (imagine that) and want to perform a clean install, first Upgrade the PC, then either run a Windows 10 reset (Start > Settings > Update & Security > Recovery > Reset this PC > Get started) or create a boot drive using the provided tool, boot from the drive, and upgrade away. The extra step -- "Upgrade this PC now" -- apparently ensures that Microsoft has, and keeps, a log of the fact that you already have a "genuine" copy of Windows 7 or Windows 8.1. With that information tucked away in Microsoft's cloud, you shouldn't need a key to validate Windows 10. If the installer asks for a key, click the link to Skip this step.I've also heard that folks who "Skip this step" suddenly, miraculously, discover that Windows 10 has been activated a day or so after it was installed.Vinod Archak, a well-respected Microsoft engineer, has more suggestions in this Answers forum post.I'm under the impression that Microsoft doesn't want to broadcast the fact that you can upgrade yourself, on your own time schedule. No doubt it's because the company has seen plenty of problems, and unless your hardware and software appears at the top of the list, running the upgrade right now is risky. I figure, eh, if you back up everything and you're willing to hose off your hard drives, why not give it a try? As always, though, I strongly advise you to refrain from upgrading your production machine(s). Let the bugs work themselves out. It'll take a while. There's nothing overwhelmingly compelling about Windows 10, although there's much to like. Many of you won't want to upgrade at all, and I'll go over 10 good reasons why early next week.Patience, grasshopper. Copyright © 2015 IDG Communications, Inc. Windows 10 breached the 70% share barrier last month when calculated as a portion of Windows-only desktops and laptops, putting the operating system on track to account for three out of every four Windows PCs by the end of January.According to U.S. analytics vendor Net Applications, Windows 10's share jumped by 2.8 percentage points, the most since January, and ended October on 64% of all systems. When figured as a fraction of Windows-only machines, Windows 10 accounted for 72.2%, a record for the five-year-old OS. This second number is the more important of the pair, as it provides the most accurate representation of Windows 10's position within the business universe, where runs-on-Microsoft remains central.(Windows 10's percentage of only Windows PCs was larger than the percentage of all personal computers because Windows did not power every system last month. In October, Windows was the OS on 88.8% of all PCs worldwide, up one-tenth of a percentage point from September. Of the remaining 11% and bits, all but a picayune 10th of a point ran macOS, Linux or Chrome OS.)Windows 10 has been piling up the share this year, pandemic and business chaos be damned. Through the first 10 months of 2020, Windows 10 has added 10.7 percentage points of share, representing a 20% increase.Meanwhile, Windows 7 took a dive almost as steep as Windows 10's climb.Windows 7 lost 2.4 points of share, plummeting to 20.4% of all personal computers, representing 23% of Windows-only PCs. The downturn was the largest one-month decline since January 2020 and the final number was a record low for Windows 7 on its post-2015 swan song. So far this year, Windows 7 has shed 9.2 points of share, which represents a 31% decline in the operating system since January 1.Windows 10 shoots for 80% by mid-2021!The major changes to Windows' shares upended the forecasts Computerworld made as recently as a month ago. Windows 10's prognostication skewed upwards compared to the one issued at the beginning of October. By April, Windows 10 should account for more than 78% of all Windows, up two percentage points from the previous prediction. Come June 2021, Windows 10 should own 80% of all Windows editions, a point above the former forecast.On the other hand, Windows 7's decline-of-doom will continue. The now-retired OS will slip under the 20% mark (of all Windows) in February 2021, two months sooner than had been expected. And by August, the operating system should be below 15%, two points lower than the forecast of a month ago. (At the end of January 2021, near the one-year anniversary of its retirement, Windows 7 will account for about 20% of all Windows, a couple of points under October's estimate.)Elsewhere in Net Applications' numbers, Linux rebounded after two consecutive months of losses, adding seven-tenths of a percentage point and bringing its total share up to 2.2 points. While that was below its peak of 3.6 points in June and July 2020, it put paid to the Computerworld theory that the sudden growth of the OS (Net Applications tallies all distributions) was little more than the aftereffects of an open-source daydream.As Linux again jumped, macOS took a drubbing, losing 1.3 points -- a one-month record -- to end up licking its wounds at 8.4%, the lowest mark of the last three years. Net Applications calculates operating system share by detecting the agent strings of the browsers used to reach the websites of Net Applications' clients. The firm tallies visitor sessions of those browsers to measure global operating system activity.Or it used to.At the same time it published October's share numbers, Net Applications announced that it was pulling the plug on its OS metrics. "October 2020 is the last month of data," the company said. "Why? An upcoming change in browsers will break our device detection technology and will cause inaccuracies for a long period of time."The change Net Applications cited would remove much of the agent string information used not only to compile analytics such as operating system share, but also by advertisers and/or scammers to "fingerprint" individuals so that they can be more thoroughly tracked as they conduct their online lives. Computerworld has not yet decided whether to continue the "Windows by the numbers" series, and if so, which alternate data source might be used.Stay tuned.
