Which are everyone to use the What is their level of technical knowledge? What are their common common points and frustrations? And above all, what are the problems they can potentially do with? Think of the user, the system, and the specific tasks; Once you've grabbed all three, you'll know how detailed your manual needs to be, as a convenient for reading in different different And as simple in terms of descriptions, explanations and instructions. Explain, describe and piece in order to help, a user guide must be easy to navigate and scroll, which means you'll must think about writing and structuring similar. Apart from the body, you'll need the table of content, an index page, glossary of terms, and reference materials as well. Any important task deserves a chapter at its own right, and even if even a bit complicated, you should think of dividing it into sub-activity to facilitate navigation. When necessary, secondary activity can be divided into small pieces of information called pieces. Start each section with a brief introduction in which you'll provide an overview of operation and finish every piece with a description of how the product or system should be similar after the secondary activity execution. Consider the case of -Then a method and predict possible scenarios for each piece in the sequence. Adjust the language, even if used by people with a more basic knowledge of technology, you'll must assume that you're King dealing with the average user and adjust your way of writing and language accordingly. This means that the manual must be clear from all technical jargon and the conditions that a reader could find confuse or even incomprehensible specialized. In addition to a simple language, effective manuals are written in active voice and with imperative verbal forms that ensure maximum clarity.
