How to delete skype call history on android phone

There are plenty of reasons why you may want to record a phone call. Google's mobile OS now has an official way to do this, but not everyone can enjoy the feature. Regardless, Android users know where there is a will, there is a way. Today we will show you various ways of keeping your mobile conversations on record. More: The 10 best dialer and contacts apps Keep in mind legal consequences may come from recording calls. It's your responsibility to research laws regarding the matter, whether they be local, state, federal, or international. You need one person's approval to record a call in some places, while other areas require permission from both parties. Some legislations may not care! Bottom line, you'll want to make sure you find out what you can and can't do before moving forward. Keep in mind legal consequences may come from recording calls.Edgar CervantesRecord calls on Android using the stock phone appKris Carlon / Android AuthorityGoogle has come up with its own way to record calls on Android. This is done straight from Google's official Phone app. Not everyone has access to it, though. There are some requirements, which we will go over right below.Requirements for recording calls using the Phone app: The device and carrier need to support the feature. You must be in a region where the feature is supported. Your device must be running Android 9 or higher. Make sure the Phone app is updated to the latest version. How to record calls using the Phone app: Open the phone app. Hit the 3-dot menu button. Select Settings. Tap on Call Recording. You'll get a series of options asking you which calls you want to be recorded. Follow instructions and hit Always record. How to start recording within a call: Make or receive a call. Look at your screen during a call. You should see a Record button on your screen. Tap Stop recording to... stop recording. Related: How to back up Android contacts Just use a voice recorderThose who don't want to deal with confusing apps, rooting, or any other complications can do things the old-fashioned way. Just get yourself a voice recorder to store conversations using the speakerphone. Quality may not be ideal, and it requires physical steps, but the simplicity may save you some headaches. Here: The best voice recorders | The best cheap voice recorders Record calls using another deviceRobert Triggs / Android AuthorityIf you have a secondary smartphone, tablet, or computer lying around, you can also use it as an improvised voice recorder. Most smartphones come with voice recorder apps pre-installed. If yours doesn't, or you want something more advanced, click the button below for our recommendations. Best voice recorder apps for Android There are dedicated call recorders too!Voice recorders and smartphone microphones work, but those who really want dedicated hardware to record calls on Android have some options. The RecorderGear PR200 uses Bluetooth, and the manufacturer claims it works with any smartphone that uses said wireless technology. It can also be used as a regular voice recorder.Some also like the Waytronic Mobile Phone Call Recording Headset. This Bluetooth headset can be used for recording, as well as listening to your music and other media. The dedicated recording button makes it easy to create clips, all while enjoying all the benefits of a Bluetooth headset. Google VoiceIf you're using Google Voice, the service has its own solution. The only real downside is that it only works with incoming calls. You also have to enable the feature first. Access your Google Voice account using the web or official app. Go into Settings. If using the web, this will be a cog button in the top-right corner. If using the app, this will be an option under the hamburger menu icon. Go to Calls. Look for incoming call options and turn the toggle on. Answer any calls to your Google Voice number. Tap the number four to start recording. An announcement informing both parties the call is being recorded will play. Press four or end the call to stop. Download Google Voice app Use a third-party app to record callsHow ToAndroid. Android 9 Pie Source: Andrew Martonik / Android Central With lots of folks working from home and video calls being used in place of face-to-face meetings, you're probably spending a lot of time in front of your computer. Services like Zoom, Google Meet, and Skype are the new conference rooms for workers all around the world, but they don't come without their quirks. If you're taking these calls from your computer's built-in webcam, chances are your video quality is pretty bad. Having a crisp image of yourself helps get the most out of your meetings, but if you have to deal with a camera that's super grainy and struggles in low light, you may find yourself pretty aggravated during all of these virtual calls. Thankfully, there is a way around this. You could go out and buy a proper webcam for your computer, or you could take your Android phone and just turn it into one. Seriously! Interested in learning how to do this? Keep on reading! How to use your phone as a webcam for your computer A quick Google search will reveal that there are a ton of apps that allow you to turn your phone into a webcam for your computer. Some popular ones include the likes of iVCam, DroidCam, and others. They all work in the same general way, with you installing an app on your phone, downloading a client to your computer, and syncing the two together. Feel free to play around with different apps to find one that works best for you, but in this example, we're using Iriun. There is a pro version you can upgrade to, but the free version works perfectly fine and supports both Windows and macOS. First thing's first, you'll want to download Iriun for your computer. Today, we're using a Mac. Open your web browser and go to iriun.com. Click Webcam for Mac (or whichever operating system you have). Source: Joe Maring / Android Central Click the .pkg file at the bottom once it's done downloading. Source: Joe Maring / Android Central Click Continue. Source: Joe Maring / Android Central Click Continue. Source: Joe Maring / Android Central Click Continue. Source: Joe Maring / Android Central Click Install. Source: Joe Maring / Android Central Click Close. Source: Joe Maring / Android Central Now that Iriun is installed on your computer, you need to finish the process by getting the app on the Android phone you'll be using. Open the Google Play Store on your phone. Search for "webcam" or "Iriun." Tap Iriun. Tap Install. Open the app. Tap Continue. Source: Joe Maring / Android Central Tap Allow to allow access to your camera. Tap Allow to allow access to your microphone. Source: Joe Maring / Android Central With this all set up and ready to go, now open the Iriun app on your computer. When you do, you should see a viewfinder of your phone's camera. It'll look just like this. Source: Joe Maring / Android Central Once that's confirmed to be working, it's time to hop into your favorite video calling app to see if it's picking up Iriun alright. As you can see in the screenshot below, Skype now gives me the choice of switching from my iMac's webcam to the Iriun one that's using my Pixel 4 camera. Source: Joe Maring / Android Central Just like that, you're now using your Android phone as a webcam for your computer. Again, there are a bunch of different apps out there that allow you to do this — we just picked Iriun as an example that you can use for free regardless if you own a Windows or Mac. You could also just join the meeting on your phone Source: Joe Maring / Android Central As you can see, it's very possible (and quite easy) to get your Android phone set up as a webcam for your computer. However, here's something else to consider — just join the meeting/video call from your phone. There are Android apps for all of the popular video calling apps out there, meaning you could just download Zoom or Skype onto your phone, join the meeting that way, and not have to mess with all of this webcam stuff. Sure, running your meeting from your desktop does allow for a larger screen to see what's going on, but most mobile apps for these services do a good job of showcasing everything on a smaller canvas. The choice is ultimately up to you, but it's just something to think about before you start tinkering around too much if you don't have to. Zoom vs. Google Duo: Which is better for you? Don't want the trouble? Here are some webcams we recommend Before we go, there's something else we want to mention — maybe you should just go out and buy a webcam. This allows you to look great for your meeting while getting the full benefits of Zoom, Skype, and Meet's desktop apps, which are more capable than their mobile counterparts. You can spend a lot of money to get a really high-end webcam, but that's far from necessary. There are plenty of excellent webcam options out there that won't make you go broke, with some of our favorites highlighted below. Lots of features for not much money Searching for a webcam that'll make you look and sound great for all of your digital get-togethers? This one from TedGem is an excellent pick. It supports 1080p Full HD recording, has a 90-degree lens to ensure you're in the frame, and comes with a built-in microphone. The webcam connects via USB and can easily attach to your laptop screen or monitor. Make sure no one's spying on you With this webcam from Dericam, you get a lot of what's offered on the TedGem model — 1080p recording, a built-in microphone, and easy plug-and-play design. What makes this one stand out is the included privacy shutter, which physically covers the webcam when you aren't using it. We may earn a commission for purchases using our links. Learn more. There might be times you need to record a call, like when you're on an important work call with someone, and recording it is easier than trying to remember all the details later. Although Android devices don't have the native ability to do so, there are a few apps in the Google Play Store that can do the job — but not all of them will give the best results. It's vital to remember that both the federal and state government have laws in place for recording phone calls, so always ensure you have consent before proceeding. Once you have the other party's authorization to record your call, our handy guide will show you how to record a phone call in Android and help you figure out which apps are worth your time. Are you an iPhone user? Check out our guide on how to record phone calls with an iPhone. Editor's Note: There are federal and state laws pertaining to the recording of phone calls. As a general rule of thumb, though, you shouldn't run into any legal trouble if you capture both parties verbally consenting to the recording. Some states require that only one party consent; however, check your state or local laws if you need further clarification. Recording calls with Google Voice Many Android users have the Google Voice app installed on their phone, which makes it easy to record phone calls using a Google Voice account. Not only that, but the app allows you to record your calls for free. Well, at least some of the calls. If you opt for Google Voice, you can only record incoming calls. First, you need a Google Voice account. If you don't have one, head to the Google Voice website and follow the on-screen instructions. Then, once your account is set up, you need to enable recording on your account, which is relatively easy to do. Step 1: Navigate to the Google Voice homepage. Step 2: Click the three vertical dots more menu located on the left and select Settings from the menu. Step 3: Scroll to the Calls section and turn on Incoming call options by using the slider on the right. Once done, you will be able to record incoming calls by simply hitting the "4" button on your keypad. When you press "4," you and the person you're talking with will hear a message saying that the recording is underway. Press "4" again, and the recording will stop and automatically save to your inbox. To access your recordings in the Voice app, head to the Menu and tap the Voicemail tab. Google Voice app You can also do this by using the Google Voice app. Click the hamburger menu located at the top right-hand corner and go to Settings. Under Calls, turn on Incoming Call Options. Recording calls with a third-party app There are many apps out there designed for recording calls on your Android phone, though some of them work better than others. We tested a few of them to see how they worked, but before diving into our suggestions, there is something to keep in mind. Most of these apps rely solely on your microphone to record both incoming and outgoing audio, which means calls that aren't recorded while on speakerphone will be a little quiet. That said, here are a couple of the better recording apps we've come across. Call Recorder S9 - Automatic Call Recorder Pro Perhaps the best call recording app around is Automatic Call Recorder Pro, largely because of how well-made the interface is. Thankfully, it doesn't just look good — it works pretty well, too. The app provides a host of customizable settings, allowing you to tweak the audio quality and set the app to record every call automatically. Another cool feature is "shake to record," which does exactly what you might think. If you want to record a call, simply shake your phone. You can also set the app to save recordings to various cloud services, such as Google Drive and Dropbox. Android Call Recorder - ACR Another good call recording app in the Google Play Store right now is ACR. There are freemium and premium versions of the app, the latter costs \$4 and gets rid of ads. The app is straightforward and looks good. It automatically records and saves calls based on a phone number and lists them in an organized way. In addition to that, the formats of recordings can range from M4As, MP3s, WAVs, and MP4s, among others. The app also deletes old recordings automatically, but if you don't want that to happen, you can mark a recording as important. Best of all, if you don't wish to record calls from a particular number, you can exclude it from recording. You can also protect recordings with a password so nobody else can access them. If you want to upload your recordings to a cloud service, ACR is compatible with popular options such as Google Drive, Dropbox, WebDAV, and OneDrive, among others. One final thing to keep in mind is that this app doesn't record Wi-Fi or VoIP calls — only cellular ones. That means that if you use the Google Fi network, which makes calls over Wi-Fi, you need to manually disable Wi-Fi to record the call. Android Recording calls with an external recorder The last method to record a phone conversation can be overcomplicated and expensive. Rather than using an app, you can buy a separate phone recorder — some plug it into your phone's 3.5mm headphone jack, but most use Bluetooth to connect to your phone. There are also call recording headsets that connect via Bluetooth, like the Waytronic Mobile Call Recording Headset, which will set you back \$49 on Amazon. We'd also recommend the RecorderGear PR200. This recorder is easy to use, connects to your phone via Bluetooth, and has a built-in speaker, so you can listen to recorded calls directly from the device — and it's available for \$109 from Amazon. True, it's a bit more expensive than the apps we mentioned earlier, but overall you are spending money for a more user-friendly and consistently more dependable option — great if you regularly record calls. At the end of the day, look to go for the method that coincides with the quality level you're seeking from your phone recordings and the amount of money you're OK with spending to acquire those results.
